

## Draw the Path: Portfolio Sitemap + Toolkit

**Type:** Assignment **Track:** General AI Fluency **When:** Week 1 **Workload:** 3h **Phase:** Setup

1. **Create one Claude Project named for this build, with custom instructions (your proof statement pasted in) and a request to act as a tutor. It follows you for all eight weeks.**

2. **Sketch a portfolio sitemap, the few pages it takes to walk your one person from landing to believing you to the one action (usually: a hero that states the claim, a work/case-studies section, a short about, a contact), and nothing more. Resist adding pages “just because.”**

Based on Claude's feedback, I will add a detailed case study for my FlyRank capstone project instead of only listing projects. This will better demonstrate my problem-solving process and make my portfolio more convincing to recruiters.

### 3. Run one real prompt: have it pressure-test your sitemap against your one action and your claim. Save the answer.

AI Portfolio Build / Machine learning portfolio website structure review

Share

I am building a personal Machine Learning portfolio website.

My one action is:  
I want visitors to contact me for Machine Learning internship and AI opportunities.

My proof statement is:  
I build practical machine learning projects using Python and real-world search data. My goal is to solve business problems using data-driven solutions while continuously improving my machine learning and software engineering skills.

My sitemap is:  
Portfolio Website

```
graph TD
    Root[Portfolio Website] --> Home[Home]
    Root --> Projects[Projects]
    Root --> About[About]
    Root --> Contact[Contact]
```

Please pressure-test this sitemap.  
Specifically:

1. Does every page support my one action?
2. Is any page unnecessary?
3. Is anything important missing?
4. What changes would make recruiters more likely to contact me?

Please explain your reasoning

Show less

Pivoted toward rigorous critique instead of surface-level validation

Good instinct to pressure-test before building — most people just start designing pages. Let's actually interrogate this.

#### 1. Does every page support the one action?

Walk through each page asking "does this page make it easier or harder for a recruiter to decide to contact me?"

- **Home** — supports it, if it's a hook + credibility signal, not a generic "Welcome to my website" landing page. Weak version: hurts you.
- **Projects** — this is your actual evidence. Should be doing 80% of the persuasion work.
- **About** — supports it *only if* it answers "why should I trust this person," not "here's my life story." Recruiters skim this in 15 seconds.
- **Contact** — directly supports it, but only if it's low-friction (see below).

So structurally, yes — every page can support the action. But right now your sitemap only tells me the skeleton exists, not whether each page is doing its job. That's the real test.

#### 2. Is any page unnecessary?

No — 4 pages is lean and appropriate for an intern-level portfolio. Don't add "Blog" or "Skills" as separate pages unless you'll actually maintain them. A half-empty Blog page actively hurts credibility (signals abandonme) ↓ Resist portfolio bloat.
